#### SCHEMATIC DIAGRAM

#### SUBCOOLING CHARGING BELOW 55°F OD AMBIENT - IN *HEATING* ONLY

- 1. The Subcool Charging Method in cooling is <u>not</u> recommended below 55°F outdoor ambient.
- The only recommended method of charging at outdoor ambients below 55°F, is to weigh in the charge in the heating mode.
- Use Nameplate charge plus standard charge adders for line length.
- Check liquid line temperature and pressure (at OD valves) to target 10–15°F subcooling in high stage.
- Add charge if a minimum of 10°F subcooling is not obtained with the nameplate charge plus line length correction.
- It is important to return in the spring or summer to accurately charge the system in the cooling mode at outdoor ambients above 55°F.

#### WIRING DIAGRAM

#### MANUAL CHARGING (HIGH STAGE ONLY) IN COOLING BETWEEN 55°F AND 120°F OD AMBIENT

The manufacturer recommends installing approved  $\underline{\text{matched}}$  indoor and outdoor systems.

All split systems are AHRI rated with only TXV indoor systems.

The benefits of installing approved indoor and outdoor split systems are maximum efficiency, optimum performance and the best overall system reliability.

The following charging methods are therefore prescribed for systems with indoor  $\mathsf{TXVs}.$ 

- Subcooling (in the cooling mode) is the <u>only</u> recommended method of charging above 55°F ambient temperatures.
- 2. For best results the indoor temperature should be kept between 70°F to 80°F. Add system heat if needed.
- At start-up, or whenever charge is removed or added, the system must be operated for a minimum twenty (20) minutes to stabilize before accurate measurements can be made.
- 4. Measure Liquid Line Temperature and Refrigerant Pressure at service valves.
- Determine total refrigerant line length, and height (lift) if indoor section is above the condenser. Use the *Subcool Charging Chart Corrections Table* to calculate any additional subcooling required for your specific application.

- 6. Determine the Design Subcooling from the unit nameplate or Service Facts.

  Add any additional amount of subcooling calculated in Step 5 to the Design Subcooling to arrive at the final subcooling value.
- 7. Locate this value in the appropriate column of the R-410-A Refrigerant Charging Chart. Locate your liquid line temperature in the left column of the chart, and the intersecting liquid line pressure under your calculated subcooling value column. Add refrigerant to raise the pressure to match the chart, or remove refrigerant to lower the pressure. Again, wait twenty (20) minutes for the system conditions to stabilize before adjusting charge again.
- 8. When system is correctly charged, you can refer to System Pressure Curves (in Service Facts) to verify typical performance.

#### **DEFROST CONTROL**

The demand defrost control measures heat pump outdoor ambient temperature with a sensor located outside the outdoor coil. A second sensor located on the outdoor coil is used to measure the coil temperature. The difference between the ambient and the colder coil temperature is the difference or delta-T measurement. This delta-T measurement is representative of the operating state and relative capacity of the heat pump system. By measuring the change in delta-T, we can determine the need for defrost. The coil sensor also serves to sense outdoor coil temperature for termination of the defrost cycle.

#### **Termination Temperature**

Defrost controls have a selectable termination temperature. As shipped, defrost will terminate at 47°F. For a higher termination temperature, cut Jumper J2 to achieve 70°F when at or below 30°F ambient.

#### **Fault Identification**

A fault condition is indicated by the flashing light on the defrost control inside the heat pump control box.

In normal operation, the defrost control light will flash once each second. If the light is flashing more than once per second or not at all, refer to the Defrost Checkout sheet found with the service information in the control box.

#### Pin Identification

- TEST\_COMMON (Shorting any of the other pins to this pin causes the function of the other pin to be executed. Leaving this pin open results in the normal mode of operation.)
- 2. TST = Test (Shorting TEST\_COMMON to this pin speeds up all defrost board timings.)
- FRC\_DFT = Forced Defrost (Short TEST\_COMMON to this pin for two [2] seconds to initiate a forced defrost. Remove the short after defrost initiates.)

#### **Defrost Control Checkout**

Normal operation requires:

- a. LED on board flashing 1 time/second.
- b. 24V AC between R & B.
- c. 24V AC between Y & B with unit operating.
- d. Defrost initiation when FRC\_DFT pin is shorted to TEST\_COMMON pin.

If a defrost control problem is suspected, refer to the service information in control box.

#### **DEFROST TERMINATION TEMPERATURE**

Defrost Termination Temperatures					
	Outdoor Temp.	Termination Temperature			
	>22°F	47°F			
As Shipped	10°F–22°F	ODT + 25°F			
	6°F–10°F	35°F			
Cut	>30°F	47°F			
Jumper 2	6°F–30°F	70°F			
All	< 6°F	12 min. or 35°F every 3 hrs.			
048E 060E	≤ 0°F	Outdoor unit will be turned OFF			
Models	≥ 5°F	Resume outdoor unit operation			

Defrost controls have a selectable termination temperature. Cutting jumper J2 (shown below) will achieve a termination temperature of 70° when the ambient temperature is below 30° (see table at left).

#### **TROUBLESHOOTING**

#### **EEV CONTROL BOARD TEST POINTS**

Note: Close Valve and Open Valve Tests are active in any mode of operation

Test Pins: OPEN, CLOSE, TEST (See EEV Board drawing for locations)

Close Valve Test - Touch CLOSE pin to TEST pin.

EEV drives closed (5 seconds max) and stays closed for 1.5 minutes (90 seconds).

- 1) Status LED will be flashing.
- 2) Gauges should indicate suction pressure dropping.
  - Valve is working.
  - LPCO may trip.

**Note**: The *Close Valve Test* will exit after 1.5 minutes (90 seconds) and will not reinitiate (requires a break and make to initialize). To clear faults stored in memory, apply a jumper between Close and Test pins for 10 seconds.

#### Open Valve Test - Touch OPEN pin to TEST pin.

EEV drives open (5 sec max) and stays open for 30 seconds.

- 1) Status LED will be flashing.
- 2) Temperature probe should indicate superheat falling.
  - · Valve is working.

**Note**: If jumper is left on pins, the OPEN VALVE TEST will be cleared after 30 seconds and will not reinitiate (requires a break and make to reinitialize).

**Exit Test Mode** - The Open Valve Test or Closed Valve Test can be cancelled by jumping to the opposite mode Test pin. The system will return to normal super heat control.

Test mode will cancel if:

- 1) Unit enters Defrost
- 2) Y1 input is lost

## Fault LED (Red)

LED	EEV	Description				
Color	Fault LED					
	OFF	Standby				
	1 Flash	Coil has an open circuit or intermittent short (Replace Coil)				
	2 Flash	Control has detected an internal failure (Replace EEV control board)				
	3 Flash	Suction Pressure Transducer input is out of range (Replace transducer) (1)				
	4 Flash	Suction Temperature Sensor input is out of range (Replace sensor) (1)				
Red	5 Flash	Coil has short circuit (Replace Coil) (2)				
		The following may require additional diagnostics				
	6 Flash	Valve is not responding to a position change command (Possible stuck valve)				
	7 Flash	Ash Valve is responding but system is not performing properly (Low charge or restriction)				
	8 Flash	Compressor is not pumping (3)				
	9 Flash	Low superheat in Cooling Mode (Indoor TXV stuck open or ID Fan failure)				
	10 Flash	Not used at this time				
	EEV Fault Codes					
	EEV not used on all models					
	(1) Valve will close and LPCO will trip					
Notes:	(2) Power supply will shut down to protect board					
		perheat and pressure: <3' SH for 5 minutes with valve @ minimum position, Monitor off-cycle compare to next on-cycle for pressure drop within 60 seconds

#### Fault Storing/Clearing:

Faults 6-9 will be stored in non-volatile memory. See Close Valve Test for fault clearing procedure. Faults 1-5 will clear with a power cycle.

#### TROUBLESHOOTING THE EEV

The **Electronic Expansion Valve (EEV)** installed in this heat pump is designed to control superheat entering the compressor when the system is running in mechanical heating mode. During cooling mode, refrigerant flow bypasses the EEV via a check valve and is controlled by the expansion device in the indoor unit. Therefore, **any operational problems observed in cooling mode are not caused by the EEV**.

The following flow chart was designed to assist in troubleshooting the EEV.

Note: The EEV closes with every OFF cycle in the heating mode of operation. During Defrost and in the cooling mode of operation, the EEV will drive to 1/2 open. An audible sound can be heard when valve is changing positions.

#### **OUTDOOR TEMPERATURE (Degree F)**

#### COOLING PERFORMANCE CAN BE CHECKED WHEN THE OUTDOOR TEMP IS ABOVE 65 DEG F.

TO CHECK COOLING PERFORMANCE, SELECT THE PROPER INDOOR CFM, ALLOW PRESSURES TO STABILIZE. MEASURE INDOOR WET BULB TEMPERATURE, OUTDOOR TEMPERATURE, DISCHARGE AND SUCTION PRESSURES. ON THE PLOTS LOCATE OUTDOOR TEMPERATURE (1); LOCATE INDOOR WET BULB (2); FIND INTERSECTION OF OD TEMP. & ID W.B. (3); READ DISCHARGE OR SUCTION PRESSURE IN LEFT COLUMN (4).

EXAMPLE: (1) OUTDOOR TEMP. 82 F.

- (2) INDOOR WET BULB 67 F.
- (3) AT INTERSECTION
- (4) DISCHARGE PRESSURE @ 1130 CFM IS 301 PSIG
- (5) SUCTION PRESSURE @ 1460 CFM IS 146 PSIG

ACTUAL:

DISCHARGE PRESSURE SHOULD BE +/- 10 PSI OF CHART SUCTION PRESSURE SHOULD BE +/- 3 PSIG OF CHART
