

UNIT INFORMATION

G40UH(X)

Corp. 0006-L3 Revised 09-2006

G40UH(X) series units are mid-efficiency gas furnaces used for upflow or horizontal applications only, manufactured with Lennox Duralok Plus heat exchangers formed of aluminized steel. G40UH(X) units are available in heating capacities of 44,000 to 154,000 Btuh and cooling applications up to 5 tons. Refer to Engineering Handbook for proper sizing.

Units are factory equipped for use with natural gas. Kits are available for conversion to LPG operation. G40UH(X) model units are equipped with a hot surface ignition system. The G40UH(X) unit meets the California Nitrogen Oxides (NO $_{\rm X}$) Standards and California Seasonal Efficiency requirements. All units use a redundant gas valve to assure safety shut-off as required by C.S.A.

All specifications in this manual are subject to change. Procedures outlined in this manual are presented as a recommendation only and do not supersede or replace local or state codes. In the absence of local or state codes, the guidelines and procedures outlined in this manual (except where noted) are recommended only and do not constitute code.

A IMPORTANT

Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a qualified installer, service agency or the gas supplier.

AWARNING

Electric shock hazard. Can cause injury or death. Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch(es). Unit may have multiple power supplies.

▲ WARNING

Sharp edges.

Be careful when servicing unit to avoid sharp edges which may result in personal injury.

² Annual Fuel Utilization Efficiency based on DOE test procedures and according to FTC labeling regulations. Isolated combustion system rating for non-weatherized furnaces.

³ Flue connection on the unit is 4 in. diameter. Most applications will require 5 in. venting and field supplied 4 x 5 in. adaptor. See Venting Tables in the Installation Instructions for detailed information.

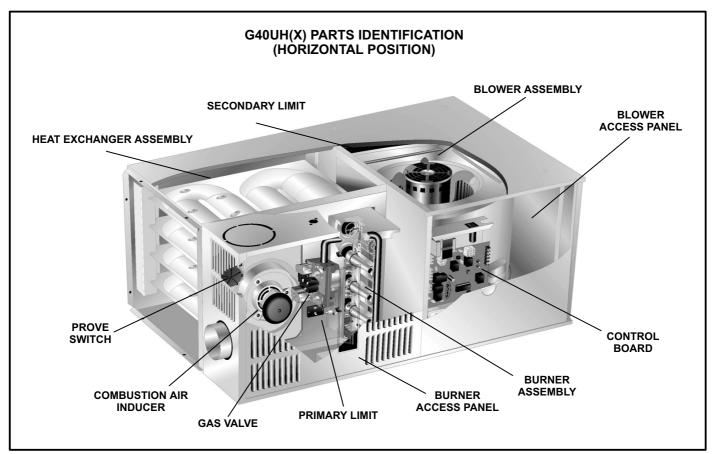

FIGURE 2

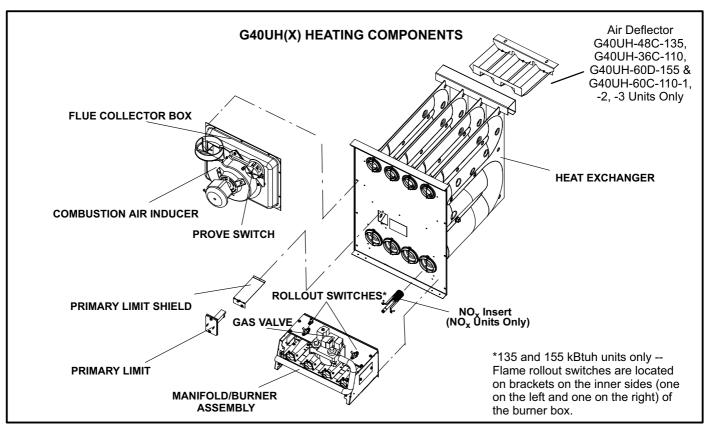

FIGURE 3

I-UNIT COMPONENTS

G40UH(X) unit components are shown in figures 1, 2, 3 and 4. The gas valve, combustion air inducer and burners can be accessed by removing the burner access panel. Electrical components are in the control box (figure 4) found in the blower section.

G40UH(X) units are factory equipped with a bottom return air panel in place. The panel is designed to be field removed as required for bottom air return. Markings are provided for side return air and may be cut out in the field.

ELECTROSTATIC DISCHARGE (ESD) Precautions and Procedures

A CAUTION

Electrostatic discharge can affect electronic components. Take precautions during furnace installation and service to protect the furnace's electronic controls. Precautions will help to avoid control exposure to electrostatic discharge by putting the furnace, the control and the technician at the same electrostatic potential. Neutralize electrostatic charge by touching hand and all tools on an unpainted unit surface, such as the gas valve or blower deck, before performing any service procedure.

1. Control Transformer (T1)

A transformer located in the control box provides power to the low voltage section of the unit. Transformers on all models are rated 40VA with a 120V primary and a 24V secondary.

2.Door Interlock Switch (S51)

A door interlock switch rated 14A at 125VAC is wired in series with line voltage. When the blower door is removed the unit will shut down.

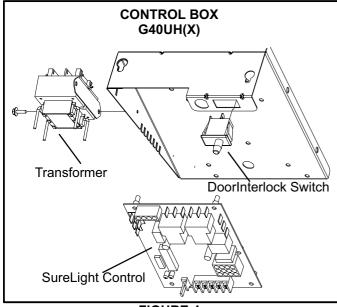

FIGURE 4

▲ WARNING

Shock hazard.

Disconnect power before servicing. Control is not field repairable. If control is inoperable, simply replace entire control.

Can cause injury or death. Unsafe operation will result if repair is attempted.

3. SureLight Integrated Ignition Control (A92) 10M93 & 56L84

The Lennox SureLight ignition system consists of ignition control (figure 5 with control terminal designations in table 1), sensor (figure 10) and ignitor (figure 11). The ignition control and ignitor work in combination to ensure furnace ignition and ignitor durability. The ignition control, controls all major furnace operations. The ignition control also features two LED lights for troubleshooting and two accessory terminals rated at (1) one amp. Tables 2 and 3 show jack plug terminal designations. See table 4 for troubleshooting diagnostic codes. Units equipped with the SureLight system can be used with either electronic or electro-mechanical thermostats without modification. The SureLight ignitor is made of durable silicon-nitride. Ignitor longevity is also enhanced by voltage ramping by the ignition control. The ignition control finds the lowest ignitor temperature which will successfully light the burner, thus increasing the life of the ignitor.

a-Electronic Ignition (See Figure 7)

On a call for heat the SureLight control monitors the combustion air inducer prove switch. The control will not begin the heating cycle if the prove switch is closed (by-passed). Once the proving switch is determined to be open, the combustion air inducer is energized. When the differential in the prove switch is great enough, the prove switch closes and a 15-second pre-purge begins. If the prove switch is not proven within 2-1/2 minutes, the control goes into Watchguard-Pressure Switch mode for a 5-minute re-set period. After the 15-second pre-purge period, the SureLight ignitor warms up for 20 seconds during which the gas valve opens at 19 seconds for a 4-second trial for ignition. Units with control 56L84: the ignitor stays energized for the first second of the 4-second trial. Units with control 10M93: ignitor stays energized the full 4 second trial. If ignition is not proved during the 4-second period, the control (56L84 or 10M93) will try four more times with an inter purge and warm-up time between trials of 35 seconds. After a total of five trials for ignition (including the initial trial), the control goes into Watchguard-Flame Failure mode. After a 60-minute reset period, the control will begin the ignition sequence again.

The SureLight control board has an added feature that prolongs the life of the ignitor. After a successful ignition, the SureLight control utilizes less power to energize the ignitor on successive calls for heat. The control continues to ramp down the voltage to the ignitor until it finds the lowest amount of power that will provide a successful ignition. This amount of power is used for 255 cycles. On the 256th call for heat, the control will again ramp down until the lowest power is determined and the cycle begins again.

b-Fan Time Control

The fan on time of 45 seconds is not adjustable. Fan off time (time that the blower operates after the heat demand has been satisfied) can be adjusted by flipping the dip switches located on the SureLight integrated control. The unit is shipped with a factory fan off setting of 90 seconds. For customized comfort, monitor the supply air temperature once the heat demand is satisfied. Note the supply air temperature at the instant the blower is de-energized. Adjust the fan-off delay to achieve a supply air temperature between 90° - 110° at the instant the blower is de-energized. (Longer delay times allow for lower air temperature, shorter delay times allow for higher air temperature). See figure 6.

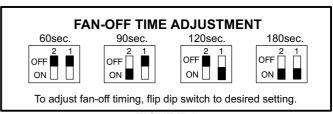

FIGURE 6

The ignition control is equipped with two LED lights for troubleshooting. The diagnostic codes are listed below in table 4.

TABLE 4

DIAGNOSTIC CODES Make sure to Identify LED'S Correctly. Refer to figures 5 and 8 for control board layout. **LED #1 LED #2 DESCRIPTION DS #1 DS #2 AN #1 AN #2 SIMULTANEOUS** Power on - Normal operation. **SIMULTANEOUS** SLOW FLASH SLOW FLASH Also signaled during cooling and continuous fan. **SIMULTANEOUS SIMULTANEOUS** Normal operation - signaled when heating demand initiated at thermostat. **FAST FLASH FAST FLASH** Primary or secondary limit switch open. 4. Integrated Ignition Control (A92) 78M47 & 100973-01

A WARNING

Shock hazard.

Disconnect power before servicing. Control is not field repairable. If control is inoperable, simply replace entire control.

Can cause injury or death. Unsafe operation will result if repair is attempted.

The hot surface ignition control system consisting of an integrated control board (figure 8 with control terminal designations in table 7), sensor (figure 10) and ignitor (figure 11). The ignition control board and ignitor work in combination to ensure furnace ignition and ignitor durability. The ignition control, controls all major furnace operations. The ignition control also features two LED lights (AN1 red and AN2 green) for troubleshooting and two accessory terminals rated at (1) one amp. The ignition control also features a (3) amp fuse for overcurrent protection. Tables 5 and 6 show jack plug terminal designations. See table 4 for troubleshooting diagnostic codes. The mini-nitride ignitor is made from a non-porous, high strength proprietary ceramic material that provides long life and trouble free maintenance. The ignition control continuously monitors line voltage and maintains the ignitor power at a consistent level to provide proper lighting and maximum ignitor life.

Electronic Ignition (See Figure 7)

On a call for heat the ignition board monitors the combustion air inducer prove switch. The control board will not begin the heating cycle if the prove switch is closed (bypassed). Once the prove switch is determined to be open, the combustion air inducer is energized. When the differential in the prove switch is great enough, the prove switch closes and a 15-second pre-purge begins. If the prove switch is not proven within 2-1/2 minutes, the control board goes into Watchguard-Pressure Switch mode for a 5-minute re-set period.

After the 15-second pre-purge period, the ignitor warms up for 20 seconds during which the gas valve opens at 19 seconds for a 4-second trial for ignition. The ignitor remains energized for the first 3 seconds during the 4 second trial. If ignition is not proved during the 4-second period, the control will try four more times with an inter purge and warm-up time between trials of 35 seconds. After a total of five trials for ignition (including the initial trial), the control goes into Watchguard-Flame Failure mode. After a 60-minute reset period, the control will begin the ignition sequence again. The control board has an added feature of ignitor power regulation to maintain consistent lighting and longer ignitor life under all line voltage conditions.

Fan Time Control

The fan on time of 45 seconds is not adjustable. Fan off time (time that the blower operates after the heat demand has been satisfied) can be adjusted by moving the jumper to a different setting. The unit is shipped with a factory fan off setting of 90 seconds. For customized comfort, monitor the supply air temperature once the heat demand is satisfied. Note the supply air temperature at the instant the blower is de-energized.

Adjust the fan-off delay to achieve a supply air temperature between 90° - 110° at the instant the blower is de-energized. (Longer delay times allow for lower air temperature, shorter delay times allow for higher air temperature). See figure 9.

Board 100973-01 only has a 45 second fan off delay after cooling demand has been met. This delay is factory set and not adjustable.

| To adjust fan-off timing, reposition jumper across pins to achieve desired setting. | | | | | |

FIGURE 9

5.Flame Sensor (Figure 10)

A flame sensor is located on the left side of the burner support. See figure 10. The sensor is mounted on the flame rollout plate and the tip protrudes into the flame envelope of the left-most burner. The sensor can be removed for service without removing any part of the burners. During operation, flame is sensed by current passed through the flame and sensing electrode. The ignition control allows the gas valve to remain open as long as flame signal is sensed.

6. Ignitor (Figure 11)

The SureLight ignitor used on G40UH units, is made of durable silicon nitride. The board finds the lowest ignitor temperature which will successfully light the burner, thus increasing the life of the ignitor. Due to this feature of the board, voltage cannot be measured. The check ignitor, measure its resistance. A value of 10.9 to 19.7 ohms indicates a good ignitor.

The mini-nitride ignitor used on G40UH units (equipped with control 78M47 or 100973-01) is made from a proprietary ceramic material. Ignitor longevity is enhanced by controlling the voltage to the ignitor. The check ignitor, measure its resistance. A value of 50 to 450 ohms indicates a good ignitor.

NOTE - The G40UH(X) furnace contains electronic components that are polarity sensitive. Make sure that the furnace is wired correctly and is properly grounded.

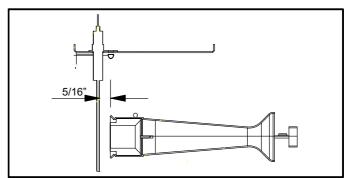

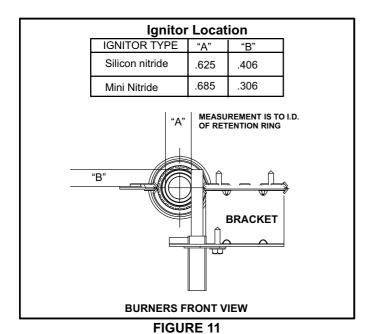

FIGURE 10

7.Combustion Air Inducer (B6)

All G40UH(X) units use a combustion air inducer to move air through the burners and heat exchanger during heating operation. The blower uses a 120VAC motor. The motor operates during all heating operation and is controlled by furnace control A92. The inducer also operates for 15 seconds before burner ignition (pre-purge) and for 5 seconds after the gas valve closes (post-purge).

A proving switch connected to the combustion air inducer orifice plate is used to prove inducer operation. The combustion air inducer orifice will be different for each model. See table 8 for orifice sizes. The switch monitors air pressure in the inducer housing. During normal operation, the pressure in the housing is negative. If pressure becomes less negative (signifying an obstruction) the proving switch opens. When the proving switch opens, the furnace control (A92) immediately closes the gas valve to prevent burner operation.

Horizontal Applications

The G40UH(X) furnace can be installed in horizontal applications.

The combustion air inducer may be rotated clockwise or counterclockwise by 90° to allow for vertical vent discharge in a horizontal application. Remove the four mounting screws, rotate the assembly (assembly consists of orifice plate, proving switch, gasket and combustion air inducer), then reinstall the mounting screws. See figure 12. Use the provided wire tie to bundle the pressure switch wires with the inducer motor power leads. Route the wires away from moving parts and the heat of the inducer motor to prevent damage to the wires. Use sheet metal shears to remove the cut out from the side of the cabinet. See figure 13. Use the two provided sheet metal screws to install the cut out on the top cap to cover the original flue outlet opening.

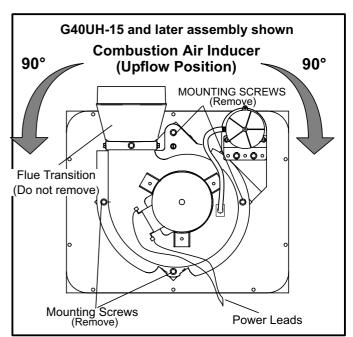

FIGURE 12

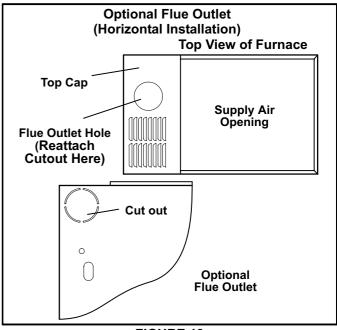

FIGURE 13 TABLE 8

| G40UH(X) Unit | C.A.I. Orifice Size |

| -135 (-6 and later units) | 2.375 |
| -155 | 2.60 |

8.Flame Rollout Switches (S47)

Flame rollout switch is a high temperature limit located on top of the burner box (135 and 155 Btuh units- rollout switches are located on inner sides of burner box). See heating components figure 3. Each furnace is equipped with two identical switches. One switch is located over the leftmost burner and the other switch is located over the rightmost burner. The limit is a N.C. SPST manual-reset limit connected in series with the ignition control A92. When S47 senses rollout, the ignition control immediately stops ignition and closes the gas valve. If unit is running and flame rollout is detected, the gas valve will close and ignition control will be disabled. Rollout can be caused by a blocked heat exchanger, flue or lack of combustion air. The switch is factory set and cannot be adjusted. See table 9. The switch can be manually reset. To manually reset a tripped switch, push the reset button located on the control.

TABLE 9

| ., • | | | |

| -135 | 200° F | | |
| -155 | | | |

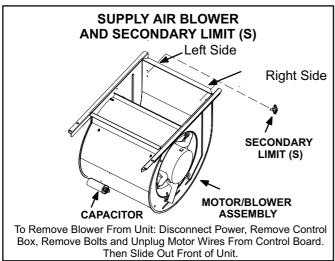

FIGURE 14

9.Blower Motors and Capacitors

All G40UH(X) units use direct drive blower motors. All motors are 120V permanent split capacitor motors to ensure maximum efficiency. Ratings for capacitors will be on motor nameplate.

NOTE - The shaft on 1 HP motors have 2 flat sides and are matched with blower wheels with 2 set screws.

10.Primary Limit Control (S10)

The primary limit (S10) on G40UH(X) units is located in the heating vestibule panel. When excess heat is sensed in the heat exchanger, the limit will open. If the limit is open, the furnace control energizes the supply air blower and closes the gas valve. The limit automatically resets when unit temperature returns to normal. The switch must reset within three minutes or SureLight board will go into Watch guard for one hour. The switch is factory set and cannot be adjusted. The switch may have a different setpoint for each unit model number. If limit switch must be replaced, refer to Lennox Repair Parts handbook.

11.Secondary Limit Controls (S21)

The secondary limit (S21) on G40UH(X) (-24A-045 will not have a secondary limit) units is located in the blower compartment in the back side of the blower housing. See figure 14. Table 10 and the blower speed chart on the wiring diagram show secondary limit quantities per unit. When excess heat is sensed in the blower compartment, the limit will open. If the limit is open, the furnace control energizes the supply air blower and closes the gas valve. The limit automatically resets when unit temperature returns to normal. G40UH-1 through -6 units use a surface type limit factory set to open at 125°F. G40UH-7 units and later, use an airstream type limit factory set to open at 135°. The secondary limit cannot be adjusted.

TABLE 10

| G40UH UNIT | Quantity | LeftSide | Right Side |
|---------------|----------|----------|------------|
| 24A-045 | 0 | No | No |

| 60D-155 | 2 | Yes | Yes |

12.Gas Valve Figures 16, 15, 17 & 18

The G40UH(X) uses a gas valve manufactured by Honeywell or White Rodgers. The valve is internally redundant to assure safety shut-off. If the gas valve must be replaced, the same type valve must be used.

24VAC terminals and gas control knob or switch are located on the valve. All terminals on the gas valve are connected to wires from the electronic ignition control. 24V applied to the terminals energizes the valve.

Inlet and outlet pressure taps are located on the valve. A regulator adjustment screw is located on the valve.

LPG changeover kits are available from Lennox. Kit s include burner orifices and a gas valve regulator conversion kit.

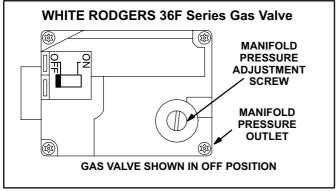

FIGURE 15

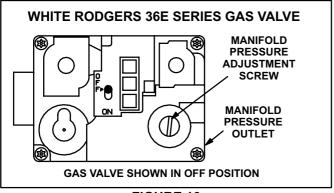

FIGURE 16

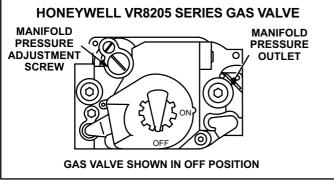

FIGURE 17

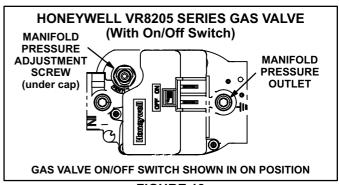

FIGURE 18

13.Combustion Air Inducer Proving Switch (S18)

G40UH(X) series units are equipped with a combustion air proving switch located on the combustion air inducer orifice bracket. The switch is connected to the combustion air inducer housing by means of a flexible silicone hose. It monitors negative air pressure in the combustion air inducer housing.

The switch is a single-pole single-throw proving switch electrically connected to the furnace control. The purpose of the switch is to prevent burner operation if the combustion air inducer is not operating or if the flue becomes obstructed.

On start-up, the switch senses that the combustion air inducer is operating. It closes a circuit to the furnace control when pressure inside the combustion air inducer decreases to a certain set point. Set points vary depending on unit size. See table 11. The pressure sensed by the switch is negative relative to atmospheric pressure. If the flue becomes obstructed during operation, the switch senses a loss of negative pressure (pressure becomes more equal with atmospheric pressure) and opens the circuit to the furnace control and gas valve. A bleed port on the switch allows relatively dry air in the vestibule to purge switch tubing, to prevent condensate build up.

The switch is factory set and is not field adjustable. It is a safety shut-down control in the furnace and must not be bypassed for any reason. If switch is closed or by-passed, the control will not initiate ignition at start up.

TABLE 11

| PROVE SWITCH SET POINTS | | | | |
|-----------------------------|---------------------------|--------------------------------|-----------------------------------|--|
| -1 to -14 Units | 0 - 4500ft (0 - 1372m) | 4501' - 7500' 1373m - 7500m | 7501' - 10,000' (2287 - 3048m) | |
| -045 | 0.47" (116Pa) | 0.36" (89Pa) | 0.36" (89Pa) | |
| -070 | 0.47" (116Pa) | 0.36" (89Pa) | 0.36" (89Pa) | |
| -090 | 0.51" (126Pa) | 0.47" (116Pa) | 0.43" (106Pa) | |
| -110 | 0.58" (.14Pa) | 0.47" (116Pa) | 0.43" (106Pa) | |
| -135 | 0.51" (126Pa) | 0.47" (116Pa) | 0.43" (106Pa) | |
| -155 | 0.51" (126Pa) | 0.47 (116a) | 0.43" (106Pa) | |
| All -15 and later models | 0.40" (99pa) | no change | 0.36" (89Pa) | |

NOTE-- -1 to -14 units require a high altitude prove switch kit if installed above 4500 ft (1370 m).

NOTE-- -15 and later units require a high altitude prove switch kit if installed above 7500 ft (2286 m).

II-PLACEMENT AND INSTALLATION

Make sure unit is installed in accordance with installation instructions and applicable codes.

III-START-UP

A-Preliminary and Seasonal Checks

- 1 Inspect electrical wiring, both field and factory installed for loose connections. Tighten as required.
- 2 Check voltage at disconnect switch. Voltage must be within range listed on the nameplate. If not, consult the power company and have voltage condition corrected before starting unit.

B-Heating Start-Up

A WARNING

Shock and burn hazard.

G40UH(X) units are equipped with a hot surface ignition system. Do not attempt to light manually.

Gas Valve Operation (Figures 16, 15, 17 and 18)

- STOP! Read the safety information at the beginning of this section.
- 2 Set the thermostat to the lowest setting.
- 3 Turn off all electrical power to the unit.
- 4 This furnace is equipped with an ignition device which automatically lights the burners. Do **not** try to light the burners by hand.
- 5 Remove the upper access panel.
- 6 Honeywell VR8205 Gas Valve with On/Off Switch -Move gas valve switch to OFF position. Do not force. See figure 17.

Honeywell VR8205 Gas Valve with Control Knob -

Turn knob on gas valve clockwise to **OFF**. Do not force. See figure 18.

White Rodgers 36E/36F Gas Valve - Move gas valve switch to **OFF position**.

- 7 Wait five minutes to clear out any gas. If you then smell gas, STOP! Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions. If you do not smell gas go to next step.
- 8 Honeywell VR8205 Gas Valve with On/Off Switch Move gas valve switch to **ON position**. Do not force. See figure 17.

Honeywell VR8205 Gas Valve with Control Knob - Turn knob on gas valve counterclockwise ♠ to ON. Do not force.

White Rodgers 36E/36F Gas Valve - Move gas valve switch to **ON position**.

- 9 Replace the upper access panel.
- 10- Turn on all electrical power to to the unit.
- 11- Set the thermostat to desired setting.

NOTE - When unit is initially started, steps 1 through 11 may need to be repeated to purge air from gas line.

12- If the appliance will not operate, follow the instructions "Turning Off Gas to Unit" and call your service technician or gas supplier.

Turning Off Gas to Unit

- 1 Set the thermostat to the lowest setting.
- 2 Turn off all electrical power to the unit if service is to be performed.
- 3 Remove the upper access panel.
- 4 Honeywell VR8205 Gas Valve with On/Off Switch Move gas valve switch to **OFF position**. Do not force. See figure 17.

White Rodgers 36E/36F Gas Valve - Switch gas valve lever to **OFF**.

5 - Replace the upper access panel.

C-Safety or Emergency Shutdown

Disconnect main power to unit. Close manual and main gas valves.

D-Extended Period Shutdown

Turn off thermostat or set to "UNOCCUPIED" mode. Close all gas valves (both internal and external to unit) to guarantee no gas leak into combustion chamber. Turn off power to unit. All access panels and covers must be in place and secured.

IV-HEATING SYSTEM SERVICE CHECKS A-C.S.A. Certification

All units are C.S.A. (formally A.G.A. and C.G.A. combined) design certified without modifications. Refer to the G40UH(X) Installation Instruction.

B-Gas Piping

Gas supply piping should not allow more than 0.5"W.C. drop in pressure between gas meter and unit. Supply gas pipe must not be smaller than unit gas connection.

Compounds used on gas piping threaded joints should be resistant to action of liquefied petroleum gases.

C-Testing Gas Piping

ACAUTION

If a flexible gas connector is required or allowed by the authority that has jurisdiction, black iron pipe shall be installed at the gas valve and extend outside the furnace cabinet.

A IMPORTANT

In case emergency shutdown is required, turn off the main shut-off valve and disconnect the main power to unit. These controls should be properly labeled by the installer.

A WARNING

Do not exceed 600 in-lbs (50 ft-lbs) torque when attaching the gas piping to the gas valve.

When pressure testing gas lines, the gas valve must be disconnected and isolated. Gas valves can be damaged if subjected to more than 0.5psig (14" W.C.). See figure 19. If the pressure is equal to or less than 0.5psig (14"W.C.), use the manual shut-off valve before pressure testing to isolate furnace from gas supply.

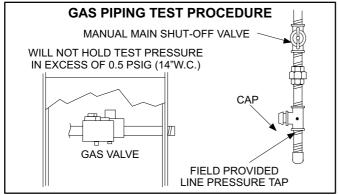

FIGURE 19

When checking piping connections for gas leaks, use preferred means. Kitchen detergents can cause harmful corrosion on various metals used in gas piping. Use of a specialty Gas Leak Detector is strongly recommended. It is available through Lennox under part number 31B2001. See Corp. 8411-L10, for further details.

Do not use matches, candles, flame or any other source of ignition to check for gas leaks.

D-Testing Gas Supply Pressure

When testing supply gas pressure, connect test gauge to inlet pressure tap (field provided). See figure 19. Check gas line pressure with unit firing at maximum rate. Low pressure may result in erratic operation or underfire. High pressure can result in permanent damage to gas valve or overfire. See table 12 for operating pressure at unit gas connection (line).

On multiple unit installations, each unit should be checked separately, with and without units operating. Supply pressure must fall within range listed in previous paragraph.

E-Check Manifold Pressure

After line pressure has been checked and adjusted, check manifold pressure. Move pressure gauge to outlet pressure tap located on unit gas valve (GV1). Checks of manifold pressure are made as verification of proper regulator adjustment. Manifold pressure for the G40UH(X) can be measured at any time the gas valve is open and is supplying gas to the unit. See table 12 for normal operating manifold pressure.

TABLE 12

| All G40UH Units | Natural | LP |
|-----------------------|------------|-------------|
| Line Pressure WC" | 4.5 - 10.5 | 11.0 - 13.0 |
| Manifold Pressure WC" | 3.5 | 10.0 |

A IMPORTANT

For safety, connect a shut-off valve between the manometer and the gas tap to permit shut off of gas pressure to the manometer.

The gas valve is factory set and should not require adjustment. All gas valves are factory regulated. See specifications section of this manual for High Altitude manifold pressure settings.

Manifold Adjustment Procedure:

- 1 Connect a test gauge to outlet pressure tap on gas valve. See figures 16, 15 and 17. Start unit and allow 5 minutes for unit to reach steady state.
- 2 While waiting for the unit to stabilize, notice the flame. Natural gas should burn blue. L.P. gas should burn mostly blue with some orange streaks.
- 3 After allowing unit to stabilize for 5 minutes, record manifold pressure.

NOTE-Shut unit off and remove manometer as soon as an accurate reading has been obtained. Take care to replace pressure tap plug.

F- Proper Gas Flow (Approximate) & Combustion

Furnace should operate at least 5 minutes before checking gas flow. Determine time in seconds for **two** revolutions of gas through the meter. (Two revolutions assures a more accurate time.) **Divide by two** and compare to time in table 13 below. Adjust manifold pressure on gas valve to match time needed. Manifold pressure should not exceed values listed in table 12. If manifold pressure matches table 12 and rate is incorrect, check gas orifices for proper size and restriction. After furnace has operated for 15 minutes take a combustion sample beyond the flue outlet and compare to table 14. The maximum carbon monoxide reading should not exceed 100ppm.

NOTE- To obtain accurate reading, shut off all other gas appliances connected to meter.

A IMPORTANT

For safety, shut unit off and remove manometer as soon as an accurate reading has been obtained. Take care to replace pressure tap plug.

| 60D-135 | 6.70 - 7.70 | 7.60 - 8.60 |
| 60D-155 | 6.80 - 7.80 | 7.80 - 8.80 |

G-Flame Signal

A microamp DC meter is needed to check the flame signal on the ignition control.

Flame (microamp) signal is an electrical current which passes from the furnace control through the sensor during unit operation. Current passes from the sensor through the flame to ground to complete a safety circuit.

To Measure Flame Signal - Ignition Control:

A transducer (Part #78H5401 available from Lennox Repair Parts) is required to measure flame signal if meter used will not read a low micro amp signal. See figure 20. The transducer converts mi-

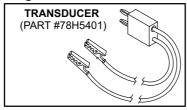

FIGURE 20

croamps to volts on a 1:1 conversion. See table15 for flame signal . A digital readout meter must be used. The transducer plugs into most meters. See figure 21 for proper use of transducer.

- 1 Set the volt meter to the DC voltage scale. Insert transducer into the VDC and common inputs. Observe correct polarities. Failure to do so results in negative (-) values.
- 2 Turn off supply voltage to control.
- 3 Disconnect ignition control flame sensor wire from the flame sensor.
- 4 Connect (-) lead of the transducer to flame sensor.
- 5 Connect (+) lead of transducer to the ignition control sensor wire.
- 6 Turn supply voltage on and close thermostat contacts to cycle system.
- 7 When main burners are in operation for two minutes, take reading. Remember 1 DC volt = 1 DC microamp.

TABLE 15

| Flame Signal in Microamps | | | | | |
|---------------------------|--------|-------------|----------|--|--|
| Control | Normal | Low | Drop Out | | |
| 56L84, 10M93 | ≥ 0.18 | 0.16 - 0.17 | ≤ 0.15 | | |
| 78M47 100973-01 | ≥ 1.5 | 0.5 - 1.4 | ≤ 0.4 | | |

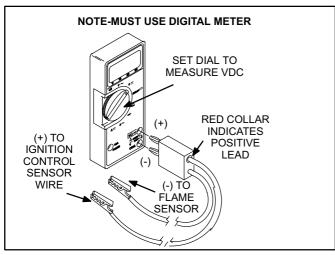

FIGURE 21

▲ WARNING

Fire and explosion hazard. These instructions MUST be followed exactly. Can cause a fire or explosion resulting in property damage, personal injury or loss of life.

V-TYPICAL OPERATING CHARACTERISTICS A-Blower Operation and Adjustment

NOTE- The following is a generalized procedure and does not apply to all thermostat controls.

- Blower operation is dependent on thermostat control system.
- 2 Generally, blower operation is set at thermostat subbase fan switch. With fan switch in ON position, blower operates continuously. With fan switch in AUTO position, blower cycles with demand or runs continuously while heating or cooling circuit cycles.
- 3 Depending on the type of indoor thermostat, blower and entire unit will be off when the system switch is in OFF position.

B-Temperature Rise

Temperature rise for G40UH(X) units depends on unit input, blower speed, blower horsepower and static pressure as marked on the unit rating plate. The blower speed must be set for unit operation within the range of "TEMP. RISE "F" listed on the unit rating plate.

To Measure Temperature Rise:

- 1 Place plenum thermometers in the supply and return air plenums. Locate supply air thermometer in the first horizontal run of the plenum where it will not pick up radiant heat from the heat exchanger.
- 2 Set thermostat to highest setting.
- 3 After plenum thermometers have reached their highest and steadiest readings, subtract the two readings. The difference should be in the range listed on the unit rating Plate. If the temperature is too low, decrease blower speed. If temperature is too high, first check the firing rate. Provided the firing rate is acceptable, increase blower speed to reduce temperature. To change blower speed taps see the Blower Speed Taps section in this manual.

C-External Static Pressure

- 1 Tap locations shown in figure 22
- 2 Punch a 1/4" diameter hole in supply and return air plenums. Insert manometer hose flush with inside edge of hole or insulation. Seal around the hose with permagum. Connect the zero end of the manometer to the dis-

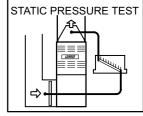

FIGURE 22

charge (supply) side of the system. On ducted systems, connect the other end of manometer to the return duct as above. For systems with non-ducted returns, leave the other end of the manometer open to the atmosphere.

- 3 With only the blower motor running and the evaporator coil dry, observe the manometer reading. Adjust blower motor speed to deliver the air desired according to the job requirements.
- 4 External static pressure drop must not be more than 0.5" W.C.
- 5 Seal around the hole when the check is complete.

D-Blower Speed Taps

Blower speed tap changes are made on the ignition control board. See figures 5 and 8. On G40DF-1 through -8 units, the heating tap is connected to the "HEAT-H" terminal and the cooling tap is connected to the "COOL-H" terminal. On G40UHF-8 and later units, the heating tap is connected to the "HEAT" terminal and the cooling tap is connected to the "COOL" terminal. On all units the continuous blower tap is the same as the heating tap and unused taps must be secured on two dummy terminals labeled "PARK. To change out existing speed tap, turn off power and switch out speed tap with tap connected to "PARK". See blower speed tap table on unit diagram for motor tap colors for each speed.

VI-MAINTENANCE

At the beginning of each heating season, the system should be checked as follows:

A-Filters

All G40UH(X) filters are installed external to the unit. Filters should be inspected monthly. Clean or replace the filters when necessary to ensure that the furnace operates properly. Replacement filters must be rated for high velocity airflow.

B- Heat Exchanger and Burners

Cleaning the Heat Exchanger and Burners

NOTE-Use papers or protective covering in front of furnace while cleaning furnace.

Cleaning the heat exchanger requires a steel spring "snake," a reversible drill and a vacuum cleaner. The steel spring snake may be constructed by purchasing a 4 ft. long by 1/4" diameter steel wire cable and a 1/4" diameter wire brush. These items are available at a hardware store. Insert wire end of brush into the open end of the spring cable. Crimp the cable around the brush so that the brush is secured and will not come off during cleaning. Attach the other end of the cable to the reversible drill to complete the tool for cleaning the heat exchanger. See figure 1 for parts arrangement when disassembling furnace.

- Turn off both electrical and gas power supplies to furnace.
- 2 Remove flue pipe and top cap from unit. Mark and disconnect wiring from prove switch and combustion air inducer.

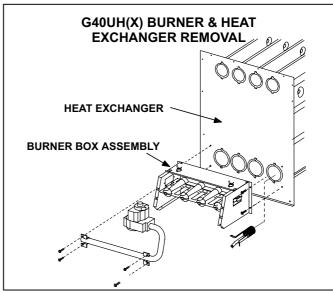

FIGURE 23

- 3 Remove four screws securing the combustion air inducer. Carefully remove the combustion air inducer and prove switch together as a unit to avoid damaging blower gasket. If gasket is damaged, it must be replaced to prevent leakage.
- 4 Remove collector box located behind combustion air inducer. Care must be taken to avoid damaging the collector box gasket. If the gasket is damaged it must be replaced to prevent leakage.
- 5 Mark then disconnect wires from gas valve and rollout switch.
- 6 Disconnect gas supply piping. Remove six screws securing the burner manifold assembly to the lower vestibule panel and remove the assembly from the unit. NO_x units only: remove screws holding NO_x inserts. Carefully remove inserts from each heat exchanger clam. See figure 24.

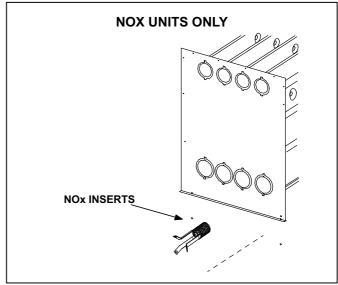

FIGURE 24

- 7 Insert brush end of cable snake into top of one of the heat exchanger openings. DO NOT FORCE CABLE INTO HEAT EXCHANGER. Once the cable has been inserted, operate drill on slow speed. Move the cable in and out of the heat exchanger section three or four times or until sufficient cleaning is accomplished. Reverse drill and slowly work cable out of opening.
- 8- Repeat procedure for each heat exchanger section.
- 9- When the top heat exchanger sections are complete, place brush end of cable snake into the bottom openings of each of the heat exchanger sections. Clean the bottom opening as described in step 7.
- 10- Remove cable from heat exchanger. Use a vacuum to remove debris knocked loose during cleaning from each heat exchanger section.
- 11- Attach the exhaust end (positive pressure) of the vacuum to the top of the heat exchanger sections. Any loose debris will be forced to the bottom of the heat exchanger section. Vacuum debris from bottom openings.
- 12- Replace collector box and combustion air inducer/prove switch combination. Check gaskets for damage. Damaged seals must be replaced to avoid heat exchanger leaks. Replace all screws to the collector box and combustion air inducer. Leaving off screws may cause leaks.
- 13- Clean burner by running a vacuum with a soft brush attachment over face of burners. Visually inspect inside of burners and crossovers for any blockage caused by foreign matter. Remove any blockage.
- 14- For NOX units, replace inserts in each heat exchanger section. **DO NOT BEND.**
- 15- Replace burner / manifold assembly onto vestibule panel.
- 16- Reconnect wires to pressure switch, roll-out switch, gas valve and combustion air inducer. Refer to unit wiring diagram.
- 17- Reconnect vent pipe to combustion blower outlet.
- 18- Reconnect gas supply piping.

- 19- Turn on power and gas supply to unit.
- 20- Set thermostat and check for proper operation.
- 21- Check all piping connections, factory and field, for gas leaks. Use a leak detecting solution or other preferred means. Rinse piping after leak test has been completed. Do not use matches, candles, flame or other sources of ignition to check for gas leaks.
- 22- If a leak is detected, shut gas and electricity off and repair leak.
- 23- Repeat steps 21 and 22 until no leaks are detected.
- 24- Replace front access panel.

A CAUTION

Potential for gas leaks, fire or explosion.
Some soaps used for leak detection are corrosive to certain metals. Carefully clean piping thoroughly after leak detection has been completed. Can cause damage to piping resulting in gas leaks, fire or explosion.

C-Supply Air Blower

- 1 Check and clean blower wheel.
- 2 Motors used on the Lennox G40UH(X) series units are permanently lubricated and need no further lubrication.

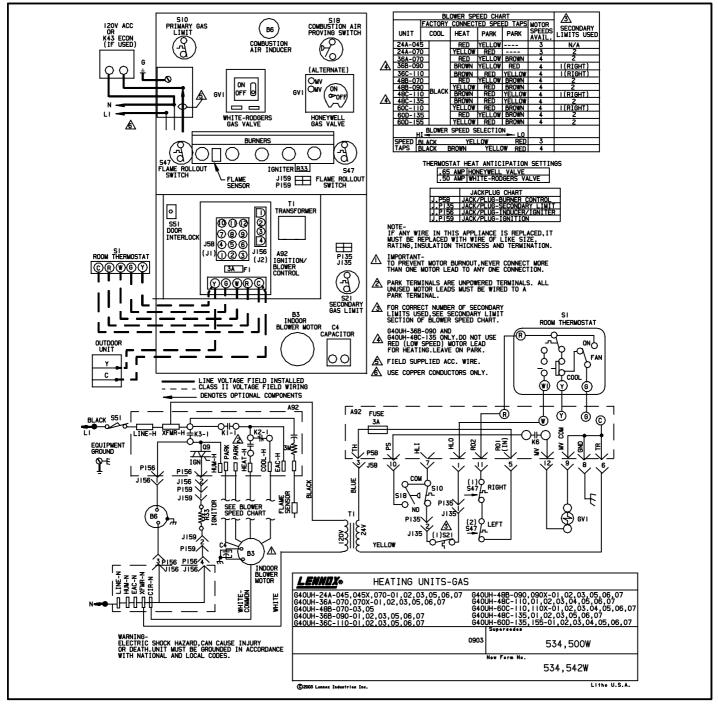

D-Flue and Chimney

Flue must conform to local codes. In the absence of local codes, flue must meet the National Fuel Gas Code ANSI-Z223.1 venting requirements. Flue pipe deteriorates from the inside out and must be disconnected in order to check thoroughly. Check flue pipe, chimney and all connections for tightness and to make sure there is no blockage or leaks.

E-Electrical

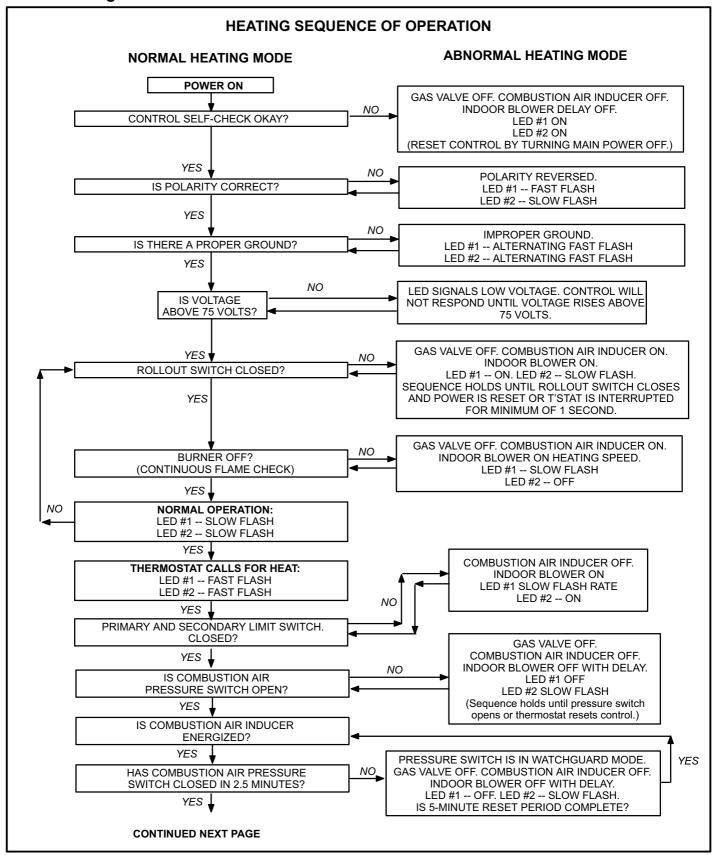

- 1 Check all wiring for loose connections.
- 2 Check for correct voltage.
- 3 Check amp-draw on blower motor.

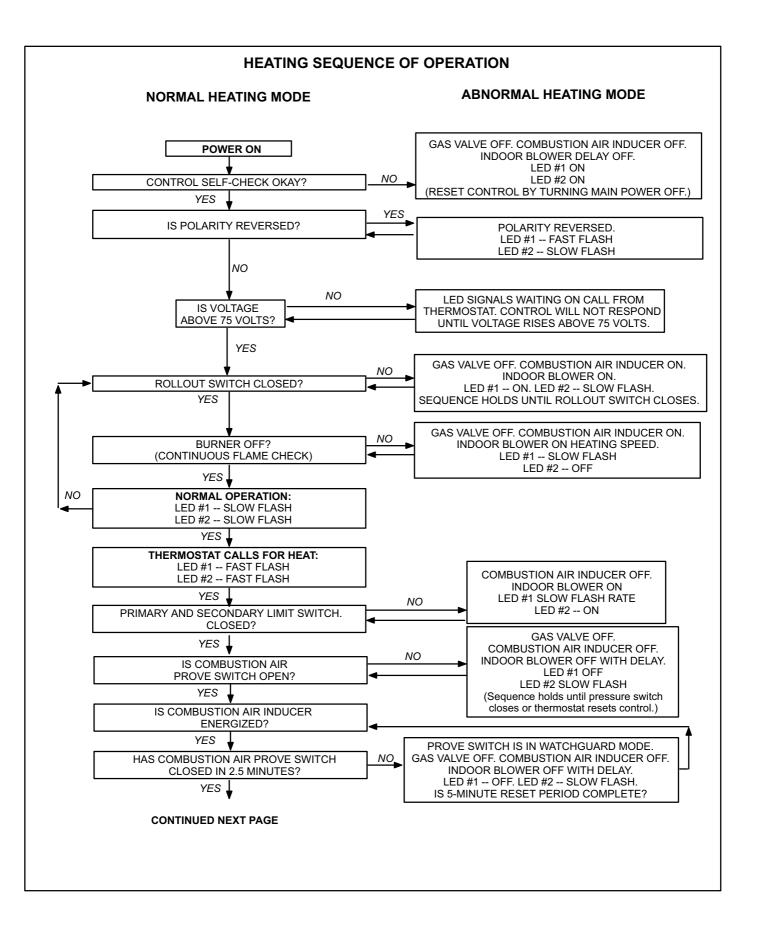

VII- Wiring and Sequence of Operation

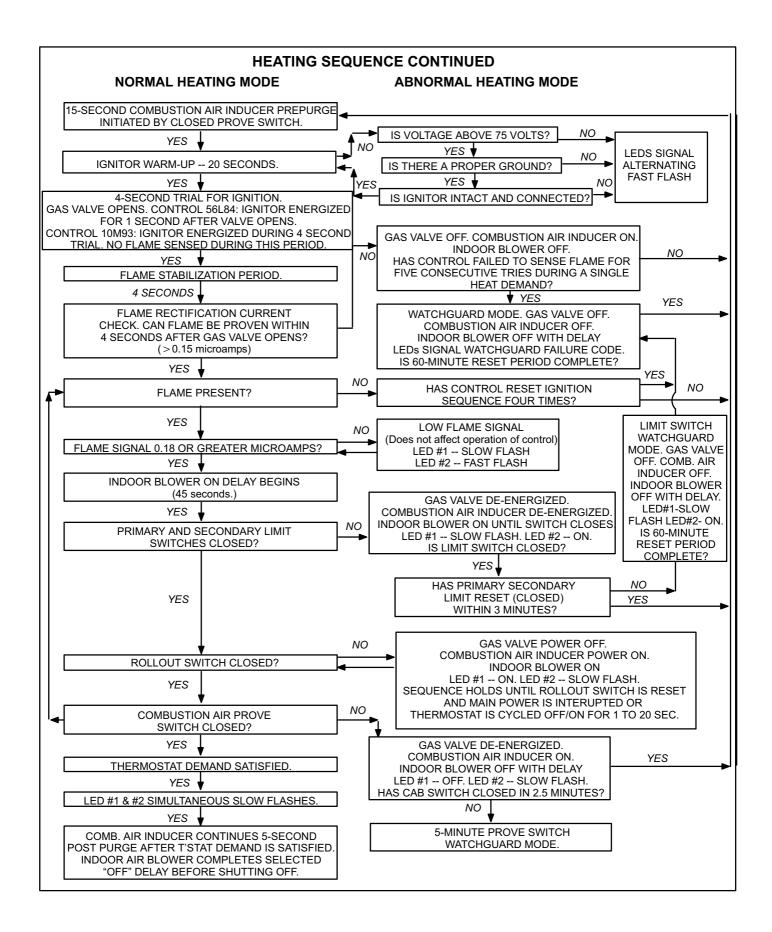

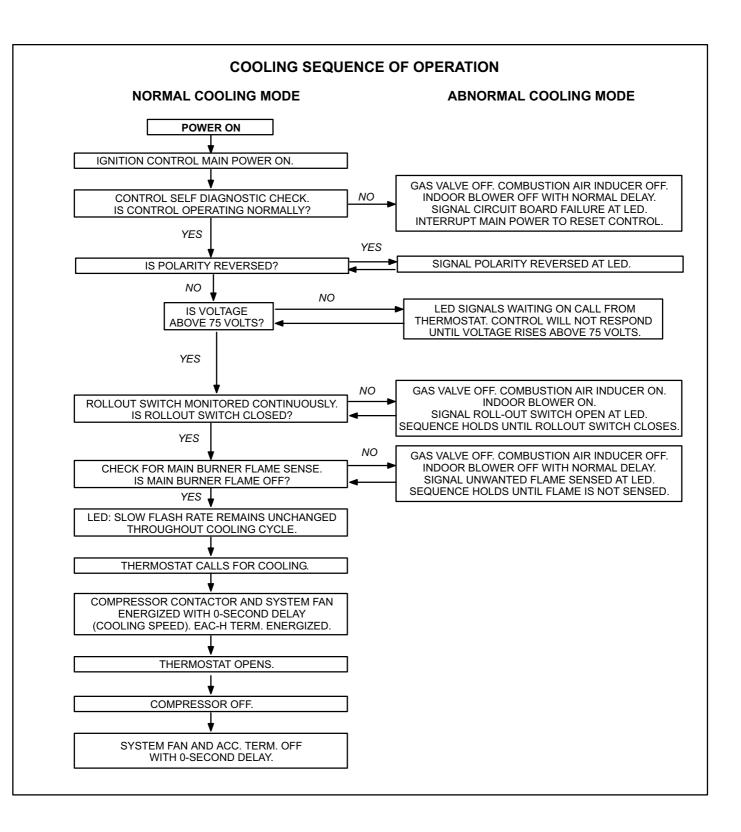

- When there is a call for heat, W1 of the thermostat energizes W of the furnace control with 24VAC.
- 2 S10 primary limit switch, S47 rollout switch and S21 secondary limit are closed. Call for heat can continue.
- 3 SureLight control (A92) energizes combustion air inducer B6. Combustion air inducer runs until S18 combustion air prove switch closes (switch must close within 2-1/2 minutes or control goes into 5 minute Watchguard Pressure Switch delay). Once S18 closes, a 15-second pre-purge follows.
- 4 SureLight control (A92) energizes ignitor. A 20-second warm-up period begins.

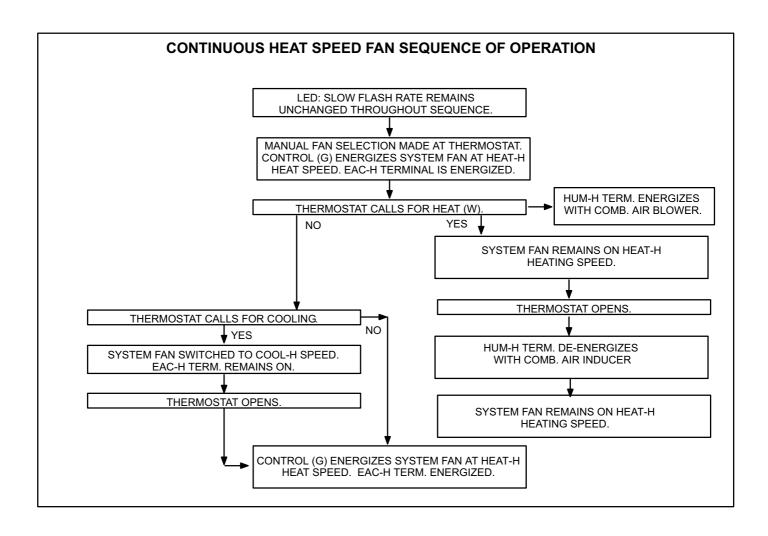

- 5 Gas valve opens for a 4-second trial for ignition
- 6 Flame is sensed, gas valve remains open for the heat call.
- 7 After 45-second delay, SureLight control (A92) energizes indoor blower B3.
- 8 When heat demand is satisfied, W1 of the indoor thermostat de-energizes W of the SureLight control which de-energizes the gas valve. Combustion air inducer B6 continues a 5-second post-purge period, and indoor blower B3 completes a selected OFF time delay.

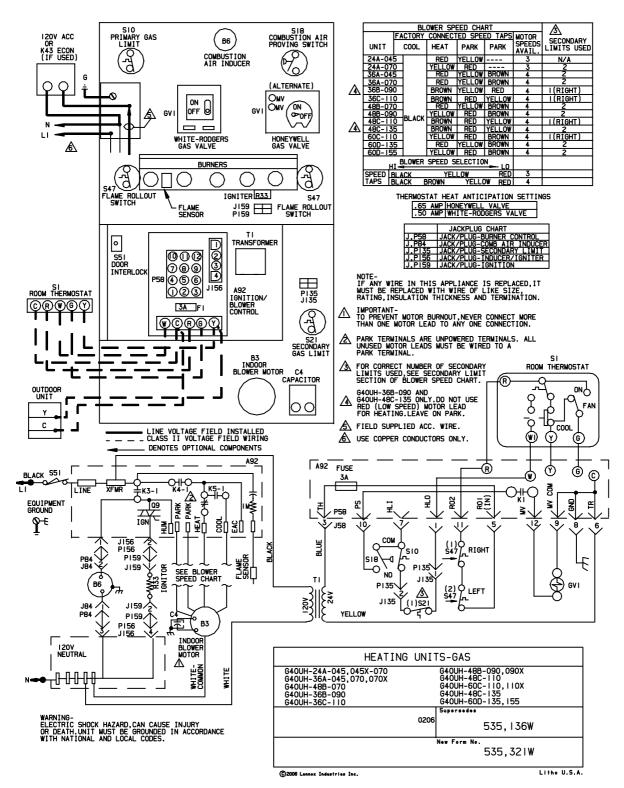

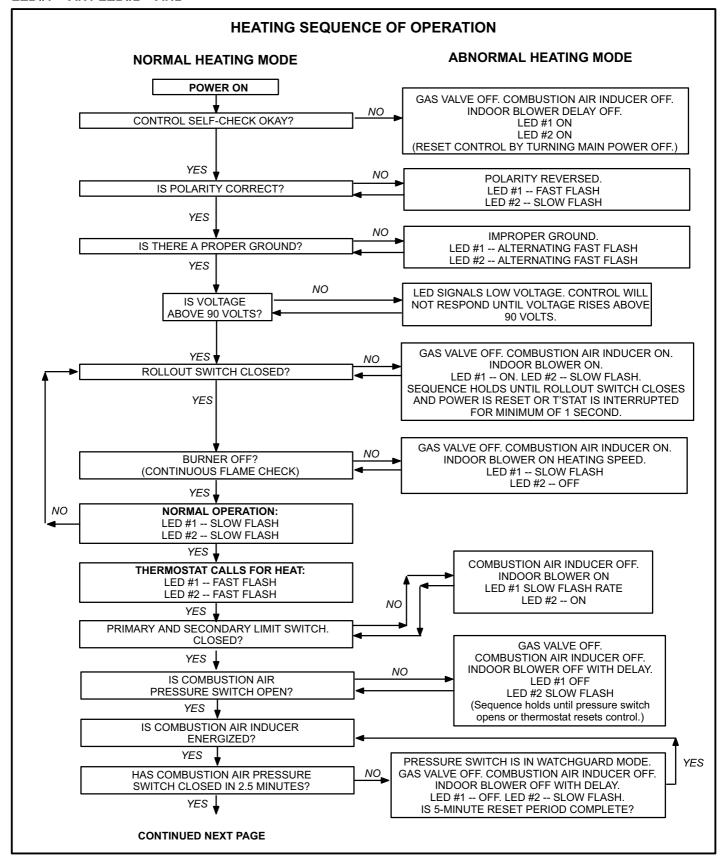

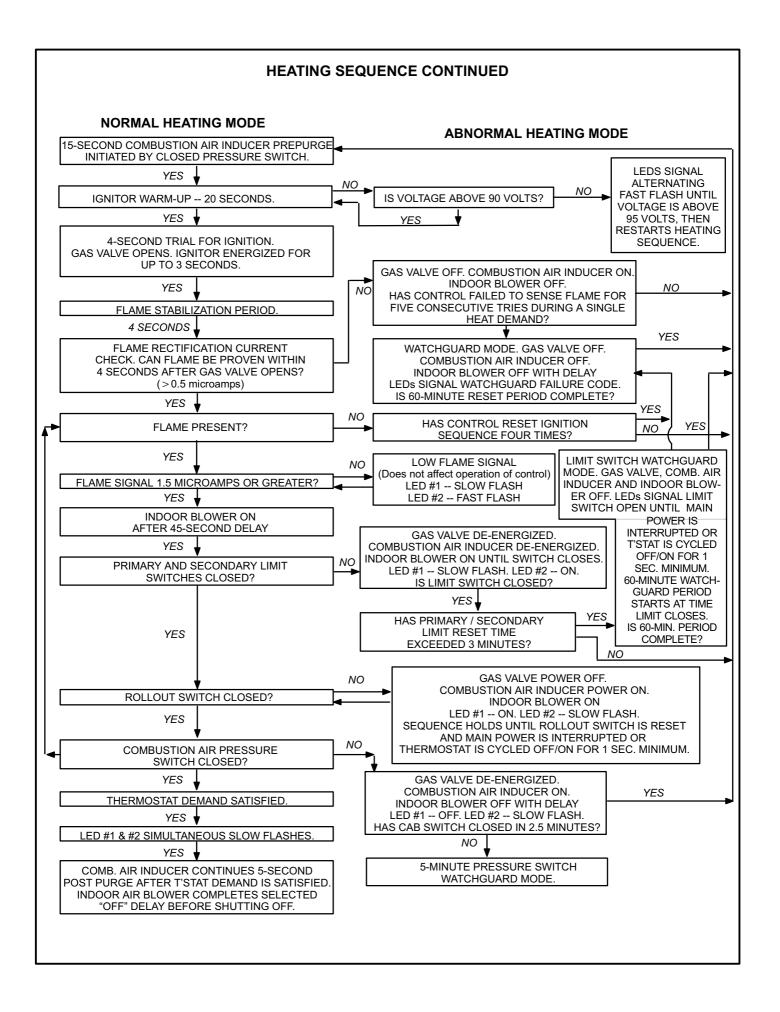

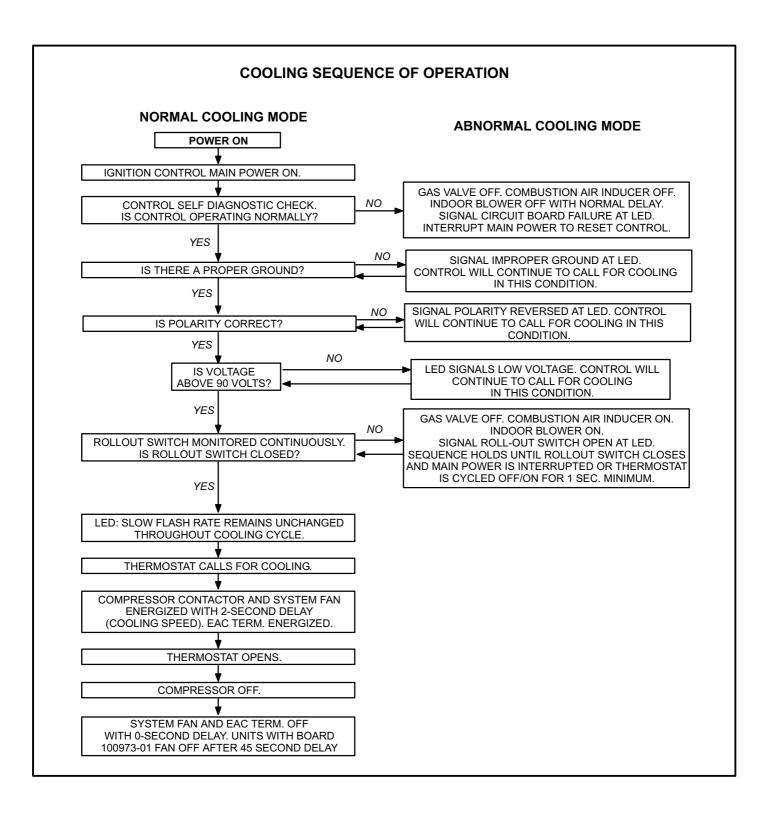

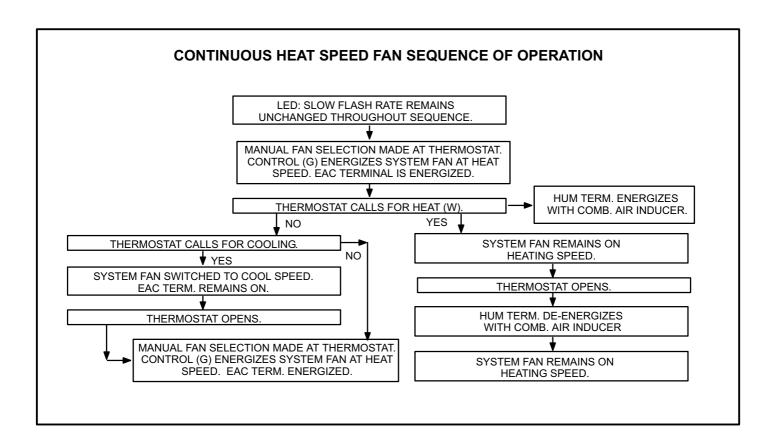

- 1 When there is a call for heat, W1 of the thermostat energizes W of the furnace control with 24VAC.
- 2 S10 primary limit switch, S47 rollout switch and S21 secondary limit are closed. Call for heat can continue.
- 3 Ignition control (A92) energizes combustion air inducer B6. Combustion air inducer runs until S18 combustion air prove switch closes (switch must close within 2-1/2 minutes or control goes into 5 minute Watchguard Pressure Switch delay). Once S18 closes, a 15-second pre-purge follows.
- 4 Ignition control (A92) energizes ignitor. A 20-second warm-up period begins.
- 5 Gas valve opens for a 4-second trial for ignition
- 6 Flame is sensed, gas valve remains open for the heat call.
- 7 After 45-second delay, ignition control (A92) energizes indoor blower B3.
- 8 When heat demand is satisfied, W1 of the indoor thermostat de-energizes W of the ignition control which de-energizes the gas valve Combustion air inducer B6 continues a 5-second post-purge period, and indoor blower B3 completes a selected OFF time delay.

TROUBLE SHOOTING GUIDE

UPON INITIAL POWER UP, REMOVE ALL THERMOSTAT DEMANDS TO THE UNIT

| PROBLEM: 1 UNIT FAILS TO OPERATE IN THE COOLING, HEATING, OR CONTINUOUS FAN MODE | | |
|--|---|--|
| Condition | Possible Cause | Corrective Action / Comments |
| 1.1 Both diagnostic lights fail to light up. | 1.1.1 Main voltage 120V not supplied to unit. | ACTION 1 - Check 120V main voltage. Determine cause of main power failure. |
| LED#1-Off LED#2-Off | 1.1.2 Miswiring of furnace or improper connections. | ACTION 1 - Check for correct wiring of 120V to power make up box and transformer. ACTION 2 - Check 24V wiring to control board. |
| | 1.1.3 Blown fuse | ACTION 1 - Replace fuse. ACTION 2 - If fuse still blows, check for short. |
| | 1.1.4 Door interlock switch failure. | ACTION 1 - Check that door switch is activated when door is closed. ACTION 2 - Check wire connections to switch, replace loose connectors. ACTION 3 - Check continuity of switch in closed position. Replace if defective. |
| | 1.1.5 Transformer Failure. | ACTION 1 - Check that transformer output is 24V. Replace if defective. |
| | 1.1.6 Failed control board. | ACTION 1 - If all the above items have been checked, replace board. |
| 1.2 Diagnostic lights flash the roll-out code. | 1.2.1 Roll-out switch open. | ACTION 1 - Manually reset the roll-out switch by pushing the top button. ACTION 2 - Determine the cause of the roll-out switch activation before leaving furnace. |
| | 1.2.2 Roll-out switch failure. | ACTION 1 - Check continuity across roll-out switch. Replace roll-out switch if switch is reset but does not have continuity. |
| LED#1-On, LED#2-Slow Flash | 1.2.3 Miswiring or improper connections at roll-out switch. | ACTION 1 - Check wiring connections to switch. |
| | 1.2.4 24 volt pin connector failure | ACTION 1 - Check pin connector for proper connection to control board. ACTION 2 - Check continuity of the multi plug pin. |
| 1.3 On initial power-up the comb. air inducer does not energize. Diagnostic lights flash the reverse polarity code. LED#1-Fast Flash, | 1.3.1 120V main power polarity reversed. | ACTION 1 - Check the 120V has line and neutral correctly input into control. ACTION 2 - Reverse the line and neutral at the 120V field connection. |
| LED#2-Slow Flash. | | |
| On initial power up the combustion air inducer does not energize. Diagnostic lights flash normal power on operation. | 1.4.1 Open combustion air inducer motor circuit. | ACTION 1 - Check for 120V to combustion air inducer. If no power, check wire and connections. |
| LED#1-Slow Flash LED#2-Slow Flash | 1.4.2 Failed combustion air inducer motor. | ACTION 1 - If power is present at blower, replace blower. |

| Condition | Possible Cause | Corrective Action / Comments |
|---|---|--|
| 1.5Diagnostic lights flash the improper main ground. | 1.5.1 | ACTION 1 - Check that the unit is properly ground. ACTION 2 - Install a proper main ground to the |
| | Improper ground to the unit. | unit |
| LED#1-Alternating Fast Flash LED#2-Alternating Fast Flash | 1.5.2120 volt Pin connector is improperly attached to the circuit board. | ACTION 1 - Check 4-pin connector for proper installation. Correctly insert connector into control. |
| • | 1.5.3 | |
| | Line voltage is below 75V. (-1 through -8 units) Line voltage is below 90V. (-9 and later units) | ACTION 1 - Check that the line voltage is above 75V. Determine cause of voltage drop and supply correct voltage to the control. |
| | 1.5.4 Open ignitor circuit. (-1 through -8 units) | ACTION 1 - Check for correct wiring and loose connections in the ignitor circuit. Check multiplug connections for correct installation. |
| | 1.5.5 | ACTION 1 - Unplug ignitor and read resistance |
| | Broken or failed ignitor. (-1 through -8 units) | across ignitor. If resistance does not read between 10.9 and 19.7 ohms, replace the ignitor. |
| PROBLEM 2: UNIT FAILS TO FIRE | E IN THE HEATING MODE, COMBU ENERGIZE | JSTION AIR BLOWER DOES NOT |
| Condition | Possible Cause | Corrective Action / Comments |
| 2.1 -Unit operates with a cooling or continuous fan demand. - Combustion air inducer will not start with a Heating demand. - Diagnostic lights flash the limit failure | 2.1.1 Primary or secondary (if equipped) limit open. | ACTION 1 - Check continuity across switch(es). Switches reset automatically upon cool down. ACTION 2 - Check for restrictions on blower inlet air (including filter) and outlet air. Determine cause for limit activation before placing unit back in operation. |
| mode. LED#1-Slow Flash, LED#2-On | 2.1.2 Miswiring of furnace or improper connections at limit switch(es). | ACTION 1 - Check for correct wiring and loose connections. Correct wiring and/or replace any loose connections. |
| 2.2 | | |
| Unit operates with a cooling and continuous fan demand. Combustion air inducer will not start with a Heating demand. Diagnostic lights flash the pressure | 2.2.1 Miswiring of furnace or improper connections to combustion air inducer. | ACTION 1 - Check for correct wiring and loose connections. Correct wiring and/or replace any loose connections. |
| switch failure code. | | 1 |

| PROBLEM 2: UNIT FAILS TO FIRE IN THE HEATING MODE, COMBUSTION AIR INDUCER DOES NOT ENERGIZE (CONT.). | | | |
|---|--|---|--|
| Condition | Possible Cause | Corrective Action/Comments | |
| 2.3 - Unit operates with a cooling and continuous fan demand. - Combustion air inducer will not start with a Heating demand. - Diagnostic lights flash the pressure | 2.3.1 Miswiring of furnace or improper connections to combustion air inducer. | ACTION 1 - Check for correct wiring and loose connections. Correct wiring and/or replace any loose connections. | |
| switch failure code 2.5 minutes after heating demand. LED#1-Off, LED#2-Slow Flash | 2.3.2 Combustion air inducer failure. | ACTION 1 - If there is 120V to combustion air inducer and it does not operate, replace combustion air inducer. | |
| PROBLEM 3: UNIT FAILS TO FIRE IN THE HEATING MODE, COMBUSTION AIR BLOWER ENERGIZES, IGNITOR IS NOT ENERGIZED. | | | |
| Condition | Possible Cause | Corrective Action/Comments | |
| 3.1 Unit operates with a cooling and continuous fan demand. Combustion air inducer energizes with a heating demand. Diagnostic lights flash the pressure switch failure code 2.5 minutes after heating demand. | 3.1.1 Prove switch does not close due to incorrect routing of the prove switch lines. | ACTION 1 - Check that the prove switch lines are correctly routed. Correctly route prove switch lines. | |
| | 3.1.2 Prove switch does not close due to obstructions in the pressure lines. | ACTION 1 - Remove any obstructions from the the pressure lines and/or taps. | |
| LED#1-Off | 3.1.3 Prove switch lines damaged | ACTION 1 - Check prove switch lines for leaks. Replace any broken lines. | |
| LED#2-Slow Flash | 3.1.4 Condensate in prove switch line. | ACTION 1 - Check prove switch lines for condensate. Remove condensate from lines. | |
| | 3.1.5 Prove switch does not close due to a low differential pressure across the prove switch. | ACTION 1 - Check the differential pressure across the prove switch. This pressure should exceed the set point listed on the switch. ACTION 2 - Check for restricted inlet vent. Remove all blockage. ACTION 3 - Check for proper vent sizing and run length. See installation instructions. | |
| | 3.1.6 Wrong prove switch installed in the unit, or prove switch is out of calibration. | ACTION 1 - Check that the proper prove switch is installed in the unit. Replace prove switch if necessary. | |
| | 3.1.7 Miswiring of furnace or improper connections at prove switch. | ACTION 1 - Check for correct wiring and loose connections. Correct wiring and/or replace any loose connections. | |
| | 3.1.8 Prove switch failure. | ACTION 1 - If all the above modes of failure have been checked, the prove switch may have failed. Replace prove switch and determine if unit will operate. | |

| PROBLEM 4: UNIT FAILS TO FIRE IN THE HEATING MODE, COMBUSTION AIR BLOWER ENERGIZES, IGNITOR IS ENERGIZED. | | |
|--|--|---|
| Condition | Possible Cause | Corrective Action/Comments |
| - Unit operates with a cooling and continuous fan demand. | 4.1.1 Check that gas is being supplied to the unit. | ACTION 1 - Check line pressure at the gas valve. Pressure should not exceed 13" WC for both natural and propane. Line pressure should read a minimum 4.5" WC for natural and 8.0"WC for propane. |
| Combustion air inducer energizes with Heating demand.Ignitor is energized but unit fails to light. | 4.1.2 Miswiring of gas valve or loose connections at multi-pin control amp plugs or valve. | ACTION 1 - Check for correct wiring and loose connections. Correct wiring and/or replace any loose connections. |
| LED#1-Alternating Slow Flash LED#2-Alternating Slow Flash | 4.1.3 Defective gas valve or ignition control. | ACTION 1 - Check that 24V is supplied to the gas valve approximately 35 seconds after heat demand is initiated. ACTION 2 - Replace the valve if 24V is supplied but valve does not open. ACTION 3 - Replace the control board if 24V is not supplied to valve. |
| PROBLEM 5: BURNERS LIGHT WITH A HEATING DEMAND BUT UNIT SHUTS DOWN PREMATURELY | | |
| Condition | Possible Cause | Corrective Action/Comments |
| 5.1 Burners fire with a heating demand. Burners light but unit shuts off prior to satisfying T-stat demand. Diagnostic lights flash the pressure switch code. | 5.1.1 Low pressure differential at the prove switch. | ACTION 1 - Check for restricted exhaust vent. Remove all blockage. ACTION 2: Check for proper vent sizing. See installation instructions. |
| LED#1-Off LED#2-Slow Flash | | |
| 5.2Combustion air inducer energizes with a heating demand. | 5.2.1 Sensor or sensor wire is improperly installed. | ACTION 1 - Check that sensor is properly located and that the sense wire is properly attached to both the sensor and the control. |
| - Burners light but fail to stay lit After 5 tries the control diagnostics flash the watchguard burners failed to ignite code. | 5.2.2 Sensor or sensor wire is broken. | ACTION 1 - Check for a broken sensor. ACTION 2 - Test continuity across the sense wire. If wire or sensor are damaged replace the component. |
| LED#1-Alternating Slow Flash LED#2-Alternating Slow Flash | 5.2.3 Sensor or sensor wire is grounded to the unit. | ACTION 1 - Check for resistance between the sensor rod and the unit ground. ACTION 2 - Check for resistance between the sensor wire and the unit ground. ACTION 3 - Correct any shorts found in circuit. |
| | 5.2.4 Control does not sense flame. | ACTION 1 - Check the microamp signal from the burner flame. If the microamp signal is below normal microamps, check the sensor rod for proper location or contamination. ACTION 2 - Replace, clean, or relocate flame sensor rod. If rod is to be cleaned, use steel wool or replace sensor. DO NOT CLEAN ROD WITH SAND PAPER. SAND PAPER WILL CONTRIBUTE TO THE CONTAMINATION PROBLEM. NOTE: Do not attempt to bend sensor rod. ACTION 3 - Check that there is proper ground to burner box. Repair as necessary. |

| PROBLEM 5: BURNERS LIGHT WITH HEATING DEMAND BUT UNIT SHUTS DOWN PREMATURELY (CONT.) | | |
|--|---|---|
| Condition | Possible Cause | Corrective Action/Comments |
| 5.3 - Combustion air inducer energizes with a heating demand. - Burners light. - Roll-out switch trips during the heating demand. - Diagnostic lights flash roll-out failure. LED#1-On LED#2-Slow Flash | 5.3.1 Unit is firing above 100% of the nameplate input. | ACTION 1 - Check that the manifold pressure matches value listed on nameplate. See installation instructions for proper procedure. ACTION 2 - Verify that the installed orifice size match the size listed on the nameplate or installation instructions. ACTION 3 - Check the input rate to verify rate matches value listed on nameplate. |
| | 5.3.2 Gas orifices leak at the manifold connection. | ACTION 1 - Tighten orifice until leak is sealed. NOTE: Be careful not to strip orifice threads. ACTION 2 - Check for gas leakage at the threaded orifice connection. Use approved method for leak detection (see unit instructions). |
| | 5.3.3 Insufficient flow through the heat exchanger caused by a sooted or restricted heat exchanger. | ACTION 1 - Check for sooting deposits or other restrictions in the heat exchanger assembly. Clean assembly as outlined in instruction manual. ACTION 2 - Check for proper combustion. |
| | 5.3.4 Burners are not properly located in the burner box. | ACTION 1 - Check that the burners are firing into the center of the heat exchanger openings. Correct the location of the burners if necessary. |
| 5.4 Combustion air inducer energizes with a heating demand. Burners light roughly and the unit fails to stay lit. Diagnostic lights flash watchguard flame failure. LED#1-Alternating Slow Flash LED#2-Alternating Slow Flash | 5.4.1 Poor Venting | ACTION 1 -Check vent pipe and remove any obstructions ACTION 2 - Check for correct exhaust vent installation. See instructions |
| | 5.4.2 Improper burner cross-overs | ACTION 1 - Remove burner and inspect the cross-overs for burrs, or any restriction or if crossover is warped. Remove restriction or replace burners. |
| | 5.4.3 Burrs in gas orifices | ACTION 1 - Remove gas orifices and inspect. Remove any burrs that are present or replace orifice. |
| | 5.4.4 Prove Switch opens 5 times during a single demand | ACTION 1 - Inspect vent pipe installation and for any restriction. Remove restriction. ACTION 2 - Check prove switch reliability. |
| 5.5 Combustion air inducer energizes with a heating demand. Burners light. Diagnostic lights flash watch guard flame failure. NOTE" Unit might go into 60 minute | 5.5.1 Loose sensor wire connection causes intermittent loss of flame signal. | ACTION 1 - Check that the sensor is properly located. ACTION 2 - Check that the sense wire is properly attached to both the sensor and the control. Pay extra attention to the pin connectors. |
| Watchguard mode depending on intermittent nature of sensor signal. LED#1-Alternating Slow Flash LED#2-Alternating Slow Flash | 5.5.2 Poor ground to burner box | ACTION 1 - Check for proper ground and repair as necessary. |

| PROBLEM 6: CONTROL SIGNALS LOW FLAME SENSE DURING HEATING MODE | | |
|---|--|--|
| Condition | Possible Cause | Corrective Action/Comments |
| One of the content of the conte | 6.1.1 Sensor rod is improperly located on the burner. | ACTION 1 - Check the sensor rod for proper location on the burner. Properly locate the sensor rod or replace if rod cannot be located correctly. |
| LED#1-Slow Flash LED#2-Fast Flash | 6.1.2 Sensor rod is contaminated. | ACTION 1 - Check sensor rod for contamination or coated surface. Clean the sensor rod with steel wool or replace sensor. DO NOT USE SAND PAPER TO CLEAN ROD. SAND PAPER WILL CONTRIBUTE TO THE CONTAMINATION PROBLEM. |
| PROBLEM 7: INDOOR BLOWER FAILS TO OPERATE IN COOLING, HEATING, OR CONTINUOUS FAN MODE | | |
| Condition | Possible Cause | Corrective Action/Comments |
| 7.0 - Indoor blower fails to operate in continuous fan, cooling, or heating mode. | 7.1.1 Miswiring of furnace or improper connections at control or indoor blower motor. | ACTION 1- Correct wiring and/or replace any loose connections. Check for correct wiring and loose connections. |
| | 7.1.2 120V is not being supplied to the indoor air blower or blower motor failure. | ACTION 1 - Check for 120V at the various calls for indoor blower by energizing "Y", "G", and "W" individually on the low voltage terminal strip. Note that when "W" is energized, the blower is delayed 45 seconds. If there is 120V to each motor tap but the blower does not operate, replace the motor. |
| | 7.1.3 Defective control board | ACTION 1 - If there is not 120V when "Y", "G", or "W" is energized, replace the control. |
| | 7.1.4 Defective run capacitor | ACTION 1 - Replace capacitor |
| PROBLEM 8: RF STATIC DURING TIME FOR IGNITION | | |
| Condition | Possible Cause | Corrective Action/Comments |
| 8.0 - AM radio interference. | 8.1.2 Ignitor operation | ACTION 1 - Call Technical Support, Dallas. |
